chemistry and metallurgical thermodynamics problems and solutions

Thermodynamics is a fundamental branch of physical science that deals with the principles governing energy transformations and the relationships between different forms of energy. In the fields of chemistry and metallurgy, thermodynamics plays a crucial role in understanding reactions, phase changes, material properties, and process efficiencies. However, students and professionals often encounter complex problems that require a systematic approach to analyze and solve. This article aims to provide comprehensive insights into common chemistry and metallurgical thermodynamics problems, along with detailed solutions and strategies to tackle them effectively.

Understanding Thermodynamics in Chemistry and Metallurgy

Thermodynamics in chemistry and metallurgy involves studying the energy changes during chemical reactions, phase transformations, and material processing. Key concepts include:

Applying this methodology consistently will improve problem-solving skills in thermodynamics.

Sample Problems and Solutions

Below are illustrative examples of typical thermodynamics problems in chemistry and metallurgy, along with detailed solutions.

Problem 1: Calculating Enthalpy Change Using Hess's Law

Question:

Given the following reactions:

- $\text{C(s)} + \text{O}_2\text{(g)} \rightarrow \text{CO}_2\text{(g)} \quad \Delta H = -393.5 \text{ kJ}$
- $\text{CO(g)} + \frac{1}{2} \text{O}_2\text{(g)} \rightarrow \text{CO}_2\text{(g)} \quad \Delta H = -283 \text{ kJ}$

Calculate the enthalpy change for the formation of CO from carbon and oxygen.

Solution:

First, write the target reaction:

Express this in terms of the given reactions:

From reaction 1: $\text{C(s)} + \text{O}_2\text{(g)} \rightarrow \text{CO}_2\text{(g)}$

From reaction 2: $\text{CO(g)} + \frac{1}{2} \text{O}_2\text{(g)} \rightarrow \text{CO}_2\text{(g)}$

Rearranged reaction 2: $\text{CO}_2\text{(g)} \rightarrow \text{CO(g)} + \frac{1}{2} \text{O}_2\text{(g)}$

Now, manipulate the reactions to derive the target:

- Reverse reaction 2:

- Use reaction 1 as is.

Now, add the reversed reaction 2 and reaction 1:

Sum:

Cancel $\text{CO}_2(\text{g})$ from both sides:

Simplify:

Sum of enthalpy changes:

$$\Delta H = \Delta H^\circ + (+283 \text{ kJ}) = -393.5 \text{ kJ} + 283 \text{ kJ} = -110.5 \text{ kJ}$$

Answer:

The enthalpy change for the formation of CO from carbon and oxygen is approximately -110.5 kJ.

Problem 2: Determining Spontaneity Using Gibbs Free Energy

Question:

Calculate the Gibbs free energy change at 25°C for the reaction:

Given data:

$$\Delta H^\circ = -10 \text{ kJ/mol}, \Delta S^\circ = -35 \text{ J/(mol}\cdot\text{K)}$$

Solution:

First, convert ΔS° to kJ/(mol·K):

$$\Delta S^\circ = 35 \text{ J/(mol}\cdot\text{K)} = 0.035 \text{ kJ/(mol}\cdot\text{K)}$$

Calculate ΔG° at 25°C (which is 298 K):

$$\Delta G^\circ = \Delta H^\circ - T\Delta S^\circ$$

$$= (-10 \text{ kJ}) - (298 \text{ K})(0.035 \text{ kJ/K})$$

$$= -10 \text{ kJ} + (298)(0.035) \text{ kJ}$$

$$= -10 \text{ kJ} + 10.43 \text{ kJ}$$

$$= +0.43 \text{ kJ}$$

Since $\Delta G^\circ > 0$, the reaction is non-spontaneous at 25°C.

Answer:

The reaction is non-spontaneous at 25°C, with $\Delta G^\circ = +0.43 \text{ kJ}$.

Solutions and Approaches to Thermodynamic Problems

Effective problem-solving in thermodynamics involves a systematic approach:

- Select Appropriate Thermodynamic Equations: Use relevant formulas such as $\Delta G = \Delta H - T\Delta S$ or phase rule equations.
- Convert Units Consistently: Ensure all data are in compatible units for calculations.
- Apply Thermodynamic Data Correctly: Use standard tables for enthalpy, entropy, and free energy values.
- Interpret Results Physically: Understand what the numerical results imply about spontaneity, phase stability, or reaction feasibility.

Examples of Problems and Solutions

Example 1: Spontaneity of a Reaction at Different Temperatures

Problem: Given $\Delta H^\circ = -100 \text{ kJ/mol}$ and $\Delta S^\circ = 200 \text{ J/mol}\cdot\text{K}$ for a reaction, determine whether it is spontaneous at 298 K and 500 K.

Solution:

Calculate ΔG° at each temperature:

- At 298 K:

$$\Delta G^\circ = \Delta H^\circ - T\Delta S^\circ$$

$$\Delta G^\circ = -100,000 \text{ J/mol} - 298 \text{ K} \cdot 200 \text{ J/mol}\cdot\text{K}$$

$$\Delta G^\circ = -100,000 - 59,600 = -159,600 \text{ J/mol}$$

Since ΔG°

- At 500 K:

$$\Delta G^\circ = -100,000 - 500 \cdot 200 = -100,000 - 100,000 = -200,000 \text{ J/mol}$$

Still spontaneous.

Conclusion: The reaction is spontaneous at both temperatures, with increased spontaneity at higher temperature.

Example 2: Phase Stability Using a Phase Diagram

Problem: An alloy with 30% component A is cooled from 1200°C. Using a binary phase diagram, determine the phases present at 900°C.

Solution:

- Locate the composition (30% A) on the x-axis.
- Draw a vertical line down to the temperature of 900°C.
- Observe the phase boundaries intersected:
- If the diagram shows a two-phase region ($\alpha + \beta$), identify the phases.
- Based on the diagram, at 900°C, the alloy is in a two-phase region comprising phases α and β with respective compositions.

Conclusion: At 900°C, the alloy consists of coexisting phases, and further cooling may lead to phase transformations.
