Fundamental Concepts in Mechanics of Solids

To grasp the mechanics of solids, one must understand several core concepts that describe how materials respond to external stimuli.

Stress and Strain

- Stress: The internal force per unit area within a material that arises when external forces are applied. It is measured in units of pressure, such as Pascals (Pa).

Equilibrium Equations

- Derived from Newton's laws, these equations ensure that internal and external forces balance within a structure.
- In differential form:

$$\nabla \cdot \sigma + \mathbf{b} = 0$$

where $\mathbf{b}$ represents body forces like gravity.

Compatibility Conditions

- Ensure that strain fields are physically consistent and compatible with the deformation of the material.

Boundary Conditions
