- **Resilience:** Flies can survive in varied environments, tolerating different temperatures and humidity levels.

The Life Cycle of Flies: From Egg to Adult

Understanding the life cycle of flies uncovers their secret strategies for survival and proliferation. Most fly species undergo complete metamorphosis, progressing through four distinct stages:

- Egg Stage

- Females lay hundreds of eggs in suitable environments such as decaying organic matter, animal feces, or moist soil.
- Eggs are tiny, often less than a millimeter in length, and hatch within a few hours to days depending on temperature and species.

- Larval Stage (Maggots)

- The larvae emerge from eggs and begin feeding voraciously.
- They are typically legless, soft-bodied, and resemble worms.
- Larvae are specialized for rapid growth, often consuming organic material to fuel pupation.

- Pupal Stage

- After reaching a certain size, larvae pupate by forming a protective casing around themselves.
- Inside the pupal casing, they undergo transformation into adult flies.
- The pupal stage duration varies but generally lasts from a few days to several weeks.

- Adult Fly

- Emerges from the pupa with fully developed wings and reproductive organs.
- Adult flies are ready to mate within a day or two, perpetuating the cycle.

Lifecycle Duration
