The liver is a vital organ with complex functions including metabolism, detoxification, synthesis of proteins, and regulation of blood composition. Liver pathology is crucial because many diseases manifest with overlapping clinical features, making histopathological examination a cornerstone of diagnosis. Accurate interpretation of liver biopsies aids in distinguishing between benign, inflammatory, infectious, metabolic, and neoplastic processes.

Types of Liver Diseases Covered in Macsween's Text

- Viral Hepatitis (A, B, C, D, E)
- Alcoholic Liver Disease
- Non-Alcoholic Fatty Liver Disease (NAFLD) and Non-Alcoholic Steatohepatitis (NASH)
- Autoimmune Hepatitis
- Cholestatic Liver Diseases (Primary Biliary Cholangitis, Primary Sclerosing Cholangitis)
- Genetic and Metabolic Disorders (Hemochromatosis, Wilson's Disease, Alpha-1 Antitrypsin Deficiency)
- Neoplastic Conditions (Hepatocellular Carcinoma, Cholangiocarcinoma)

Histopathological Features of Liver Diseases

Normal Liver Histology

A foundational understanding of normal liver architecture is essential. The liver comprises hepatocytes arranged in plates radiating from the portal tracts, with sinusoids facilitating blood flow. The portal triads contain branches of the hepatic artery, portal vein, and bile duct. Central veins drain into hepatic veins.

Key Histopathological Changes in Liver Diseases

- **Inflammation:** Portal and lobular inflammation characterized by lymphocytes, plasma cells, and occasionally neutrophils.
- **Fibrosis:** Collagen deposition leading to bridging fibrosis and cirrhosis.
- **Steatosis:** Accumulation of fat within hepatocytes.
- **Necrosis:** Hepatocyte death, ranging from apoptosis to massive necrosis.
- **Regenerative Changes:** Hepatocyte proliferation and nodular regeneration in cirrhotic liver.
- **Vascular Changes:** Sinusoidal dilation, congestion, or vascular proliferation.

Diagnostic Approach in Macsween?s Pathology of the Liver

Histological Examination

The cornerstone of diagnosis involves liver biopsy analysis, which includes gross examination, histological staining, and special techniques. The choice of biopsy technique (percutaneous, transjugular, laparoscopic) depends on clinical context.

Ancillary Tests and Molecular Diagnostics

- Immunohistochemistry for specific markers (e.g., HepPar-1, Glypican-3)
- In situ hybridization for viral genomes
- Genetic testing for metabolic disorders
- Serologic markers correlated with histology

Correlation with Clinical and Laboratory Data

Integrating histopathological findings with clinical history, laboratory results, imaging, and serology ensures accurate diagnosis. For example, the presence of interface hepatitis with elevated transaminases suggests autoimmune hepatitis, whereas iron overload on histology indicates hemochromatosis.

- Mixed injury: Features of both hepatocellular and cholestatic damage.

Recognizing these patterns assists in narrowing differential diagnoses.

Major Categories of Liver Disease in Macsween's Pathology

A. Steatosis and Steatohepatitis

Steatosis involves abnormal accumulation of triglycerides within hepatocytes, often due to metabolic syndrome, alcohol, or drugs.

Steatohepatitis adds inflammatory infiltrates and hepatocyte injury to simple steatosis, progressing to fibrosis.

- Histological features include:
- Macrovesicular fat droplets displacing the nucleus.
- Ballooning degeneration.
