Core Features and Benefits of the Naviknot Multisensor Speed Log Series

2.1 Multisensor Integration for Enhanced Accuracy

One of the defining features of the Naviknot Series is its multisensor approach. Unlike traditional speed logs that rely solely on one measurement method, Naviknot integrates several sensing technologies to mitigate errors caused by environmental factors.

Key sensors include:

- Doppler Sonar: Uses ultrasonic signals to measure water speed relative to the vessel, providing accurate readings even at low speeds or when the vessel is stationary.
- Impeller-based Sensors: Traditional mechanical sensors that measure water flow through a spinning impeller, effective in open water conditions.
- Electromagnetic Sensors: Measure water flow via electromagnetic induction, less affected by biofouling or debris.
- GPS-based Speed Over Ground (SOG): Provides vessel speed relative to the Earth's surface for cross-reference and calibration.

By combining these sensors, the Naviknot system can cross-verify data, reduce discrepancies, and present the most accurate speed information under varying conditions.

2.2 Robust Design for Marine Environments

The Naviknot Speed Log Series is engineered with durability in mind. Features include:

- Corrosion-resistant materials: Suitable for harsh marine environments.
- Waterproof and sealed enclosures: Protect internal electronics from moisture and salt ingress.
- Vibration and shock resistance: Ensures stable operation amidst rough seas.

Technological Breakdown of the Multisensor System

2.1 How the Sensors Work

Doppler Sonar: Utilizes ultrasound waves emitted into the water. The frequency shift of the returning echoes correlates to water velocity relative to the vessel, providing high-precision readings in various conditions, including high currents or low speeds.

Impeller-based Sensors: Mechanical impellers spin as water flows past them, generating electrical signals proportional to water speed. While cost-effective, they are susceptible to fouling and damage in certain environments.

Electromagnetic Sensors: Use electromagnetic induction principles; water flowing through a magnetic field generates a voltage proportional to flow speed. These sensors are less prone to biofouling and debris interference.

GPS SOG: Although not a sensor per se, GPS data serves as an essential reference point, especially when water conditions cause other sensors to falter.

2.2 Sensor Fusion Algorithms

The heart of the Naviknot system lies in its ability to synthesize data from multiple sensors. The onboard processor:

- Compares readings from all sensors.
- Applies weighting algorithms to prioritize the most reliable signals.
- Detects anomalies or discrepancies.
- Outputs a unified, highly accurate speed measurement.

This fusion process enhances reliability, ensures consistency, and reduces the likelihood of incorrect readings that could impact navigation or safety.
