Sample PADI Open Water Final Exam Questions and Answers

Below are some typical questions you might encounter, along with explanations to help you understand the correct answers.

Physics and Physiology Questions

- **Question:** What is the primary reason divers need to equalize their ears during descent?
- **Answer:** To prevent pain and injury caused by pressure differences between the middle ear and the environment. Equalizing balances the pressure, allowing for comfortable and safe descent.
- **Question:** Which gas law explains why a diver's lungs expand as they ascend?
- **Answer:** Boyle's Law, which states that at constant temperature, the volume of a gas increases as pressure decreases. As a diver ascends, the pressure decreases, causing the air in the lungs to expand.
- **Question:** What are the symptoms of nitrogen narcosis?
- **Answer:** Symptoms include impaired judgment, euphoria, dizziness, tunnel vision, and poor decision-making. It's important to recognize these signs and ascend if necessary.

Equipment and Safety Questions

- **Question:** How often should a diver check their equipment before a dive?
- **Answer:** Before each dive, performing a thorough equipment check is essential to ensure all gear functions properly, including checking air supply, regulators, BCD, and gauges.
- **Question:** What is the purpose of a dive computer?
- **Answer:** To monitor depth and elapsed time during a dive, calculate no-decompression limits, and help manage ascent rates, enhancing safety.
- **Question:** When should a diver perform a regulator recovery?
- **Answer:** If the regulator is knocked out of the mouth or lost, the diver should recover it by reaching for it, clearing it if necessary, and then re-inserting it properly.

Skills and Emergency Procedures Questions

- **Question:** How do you clear a flooded mask underwater?
 - **Answer:** Tilt your head back, exhale through your nose into the mask, and then gently lift the mask off your face or tilt it upward to clear water.
 - **Question:** What is the recommended procedure if a fellow diver is unresponsive during a dive?
 - **Answer:** Signal to the surface, initiate rescue procedures as trained, provide rescue breaths if necessary, and seek emergency assistance immediately.
 - **Question:** When should a diver perform an emergency ascent?
- Answer:** When faced with an equipment failure, loss of air, or other safety concerns that require urgent ascent to the surface to ensure safety.

Sample Questions and Detailed Answers

Below are representative questions often encountered in the PADI Open Water final exam, along with comprehensive explanations to deepen your understanding.

Question 1: What is Boyle's Law?

- A. The pressure of a gas increases as the temperature increases, provided the volume remains constant.
- B. The pressure of a gas increases as the volume decreases, provided the temperature remains constant.
- C. Gases expand when pressure increases.
- D. The volume of a gas increases as the pressure decreases, provided the temperature remains constant.

Correct Answer: B

Explanation: Boyle's Law states that at constant temperature, the pressure of a gas is inversely

proportional to its volume. This means that as you descend underwater and pressure increases, your body's air spaces (like ears and sinuses) are compressed, which is why equalization is necessary. Conversely, ascending causes pressure to decrease and air spaces to expand, requiring careful ascent and breathing control.

Question 2: Why is it important to perform a pre-dive safety check with your buddy?

- A. To ensure both of you are aware of each other's equipment and plan.
- B. To confirm that all gear is functioning correctly and safety procedures are understood.
- C. To review emergency signals and plan for potential problems.
- D. All of the above.

Correct Answer: D

Explanation: A pre-dive safety check, often called the "buddy check," is vital for ensuring dive safety. It allows both divers to verify equipment functionality, review emergency protocols, confirm communication signals, and discuss dive plans, reducing the risk of accidents or equipment failure underwater.

Question 3: What is the primary purpose of a buoyancy control device (BCD)?

- A. To carry the tank and weight system.
- B. To help the diver control their buoyancy and maintain neutral buoyancy underwater.
- C. To help the diver descend faster.
- D. To measure depth accurately.

Correct Answer: B

Explanation: The BCD's main function is to allow divers to control their buoyancy by adding or releasing air, helping them hover at a desired depth effortlessly. Proper buoyancy control conserves energy, protects the environment, and makes for a more comfortable dive.

Question 4: During a dive, your air gauge shows that you have 100 bar remaining. You started with a full tank at 200 bar. How much air have you used?

- A. 50 bar
- B. 100 bar
- C. 200 bar
- D. 1000 bar

Correct Answer: B

Explanation: The starting pressure was 200 bar, and now it's at 100 bar. The difference (200 - 100) equals 100 bar, which indicates you've used approximately half of your air supply. Monitoring air consumption is crucial for safe ascent planning and ensuring you have enough air to complete your dive and ascend safely.

Question 5: What should you do if you experience equalization problems during descent?

- A. Continue descending rapidly to force the ears to equalize.
- B. Ascend slightly, then try to equalize again.
- C. Ignore the discomfort and proceed.
- D. Remove your mask immediately.

Correct Answer: B

Explanation: If you have difficulty equalizing, the safest approach is to ascend slightly to reduce pressure and then attempt to equalize again. Forcing equalization or descending rapidly can cause ear barotrauma. If persistent problems occur, it's best to abort the dive and consult with a dive professional.
