Question What are the key mechanisms involved in the pathophysiology of congestive heart failure commonly tested in Masaryk University exams? Key mechanisms include impaired myocardial contractility, increased preload and afterload, neurohormonal activation (such as the renin-angiotensin-aldosterone system), and structural remodeling of the heart, all contributing to decreased cardiac output and clinical symptoms. How does the pathophysiology of diabetes mellitus type 2 relate to insulin resistance and beta-cell dysfunction, as emphasized in the exam syllabus? Type 2 diabetes involves a progressive decline in insulin sensitivity primarily due to insulin resistance in peripheral tissues, combined with eventual beta-cell dysfunction and decreased insulin secretion, leading to hyperglycemia. What are the typical pathophysiological changes observed in atherosclerosis that are frequently examined in the course at Masaryk University? Atherosclerosis involves endothelial injury, lipid accumulation in the intima, foam cell formation, plaque development, and potential plaque rupture, which can lead to ischemic events such as myocardial infarction or stroke. In the context of respiratory pathophysiology, what mechanisms cause hypoxia in chronic obstructive pulmonary disease (COPD)? Hypoxia in COPD results from airflow limitation due to airway inflammation and destruction of alveolar walls, leading to impaired gas exchange, ventilation-perfusion mismatch, and hypoventilation. Describe the pathophysiological basis of anemia in chronic kidney disease that is often featured in Masaryk University exam questions. Anemia in chronic kidney disease results from decreased erythropoietin production by damaged renal tissue, leading to reduced stimulation of erythropoiesis, combined with iron deficiency, inflammation, and shortened red blood cell lifespan. What are the main inflammatory pathways involved in the pathophysiology of rheumatoid arthritis as covered in the exam topics? Rheumatoid arthritis involves autoantibody formation (such as rheumatoid factor), activation of T-cells and macrophages, cytokine release (like TNF-alpha, IL-6), leading to synovial inflammation, pannus formation, and joint destruction.
