Strategies for Approaching Solved MCQs in Economics

- Understand the Concept, Not Just Memorize

Economics concepts are interconnected. Focus on understanding the underlying principles rather than rote memorization. For example, grasp the concept of elasticity before attempting questions related to price sensitivity.

- Analyze the Question Carefully

Read each question thoroughly, noting keywords like "ceteris paribus," "inverse relationship," or specific data points. These clues guide you toward the correct reasoning.

- Eliminate Implausible Options

Use logical deduction to discard clearly incorrect choices, increasing your chances of selecting the correct answer.

- Refer to Theoretical Foundations

When in doubt, recall relevant theories, models, or formulas. For instance, understanding the formula for price elasticity helps solve related questions efficiently.

- Practice Regularly with Solved MCQs

Consistent practice consolidates knowledge, improves speed, and familiarizes you with question patterns.

Curated Examples of Solved MCQs in Economics

Below are several representative solved MCQs, each accompanied by detailed reasoning and insights.

Example 1: Demand and Elasticity

Question:

If the price elasticity of demand for a good is 0.5, what will be the percentage change in quantity demanded if the price decreases by 10%?

- A) 5% increase
- B) 2% increase
- C) 20% increase

D) 50% increase

Correct Answer: B

Solution and Explanation:

Price elasticity of demand (PED) is calculated as:

$$PED = \frac{\% \text{Change in Quantity Demanded}}{\% \text{Change in Price}}$$

Given:

$$PED = 0.5$$

$$\% \text{Change in Price} = -10\% \text{ (decrease, hence negative)}$$

Rearranging to find the percentage change in quantity demanded:

$$\% \text{Change in Quantity Demanded} = PED \times \% \text{Change in Price}$$

$$= 0.5 \times (-10) = -5\%$$

Since demand increases when prices decrease, the magnitude is positive:

Answer: 5% increase

But note that the question asks for the percentage change in quantity demanded when price decreases by 10%. Because the demand is inelastic (PED

Correct choice: B) 2% increase is not correct; the actual calculation yields 5%. But since B says 2%, we need to re-express. Let's check options.

Actually, the calculation shows 5%. Therefore, the correct answer should be A) 5% increase.

Correction: The initial options had a mistake. The correct answer is:

Answer: A) 5% increase

Key insight: The importance of understanding the sign conventions and the actual calculation process.

Example 2: Market Equilibrium

Question:

In a perfectly competitive market, if demand increases while supply remains unchanged, what is likely to happen?

- A) Price falls, quantity decreases
- B) Price rises, quantity remains unchanged
- C) Price rises, quantity increases
- D) Price remains unchanged, quantity increases

Correct Answer: C

Explanation:

An increase in demand shifts the demand curve outward/rightward. With supply unchanged, this leads to:

- Higher equilibrium price (due to increased competition among buyers)
- Higher equilibrium quantity (more goods are demanded at the new higher price)

Thus, the market moves to a new equilibrium with both price and quantity higher.

Answer: C) Price rises, quantity increases

Educational takeaway: Recognizing demand-supply shifts helps anticipate outcomes in market equilibrium.

Example 3: Fiscal Policy Impact

Question:

An increase in government expenditure, assuming other factors constant, will most likely result in:

- A) Decreased aggregate demand
- B) Increased aggregate demand

C) No change in aggregate demand

D) Increased aggregate supply

Correct Answer: B

Explanation:

An increase in government expenditure is a component of aggregate demand (AD). When government spending increases:

- Aggregate demand shifts rightward
- This tends to increase overall output and prices in the short run

Therefore, the most probable outcome is an increase in aggregate demand.

Answer: B) Increased aggregate demand

Key learning point: Fiscal policy tools directly influence aggregate demand levels.
