Question What are the common safety precautions to follow during chemistry practicals for class 9? Always wear safety goggles, lab coats, and gloves; handle chemicals carefully; avoid inhaling fumes; dispose of waste properly; and follow instructions carefully to ensure safety during experiments. **Answer** How do you prepare a standard solution in class 9 chemistry practicals? Weigh the accurate amount of solute, dissolve it in a small amount of solvent, transfer it to a volumetric flask, and add solvent up to the marked level to prepare a precise standard solution. What is the purpose of titration in chemistry practicals? Titration is used to determine the concentration of an unknown solution by reacting it with a solution of known concentration until the reaction is complete. How do you identify a chemical substance in a practical experiment? Identification involves performing specific tests such as flame tests, acid-base reactions, or solubility tests to observe characteristic reactions and properties of the substance. What are the main types of chemical reactions studied in class 9 practicals? The main types include combination reactions, decomposition reactions, displacement reactions, and double displacement reactions. Why is it important to wash and dry apparatus before and after use? Washing and drying prevent contamination and ensure accurate results by removing residues, chemicals, or moisture that could interfere with subsequent experiments. How is pH measured in chemistry practicals and why is it important? pH is measured using pH paper or a pH meter to determine the acidity or alkalinity of a solution, which is crucial for

understanding chemical properties and reactions. What is the procedure for testing the presence of carbon dioxide gas? Pass the gas through lime water; if it turns milky or cloudy, it indicates the presence of carbon dioxide gas due to the formation of calcium carbonate. How do you prepare a salt from an acid and base in practical chemistry? React the acid with an excess of a base (or vice versa), then filter the solution and evaporate the water to obtain the salt crystals. What are the common indicators used in titration experiments and their purpose? Indicators like phenolphthalein and methyl orange are used to signal the end point of titration by changing color when the reaction is complete.
