Understanding the Operation of the HPR25 Air Dryer

How Does the HPR25 Work?

The HPR25 uses a refrigeration cycle to cool the incoming compressed air, causing moisture to

condense and separate from the air stream. The process involves several key components:

- **Air Intake:** Compressed air enters the dryer and passes through a filter that removes large particulates.
- **Cooling Coils:** The air then flows over refrigeration coils cooled by a compressor, reducing its temperature.
- **Condensation:** As the air cools, water vapor condenses into liquid water, which separates from the dry air.
- **Separation Chamber:** The moisture-laden condensate collects in a reservoir or is expelled via automatic drain valves.
- **Reheated Dry Air:** The now dry air is reheated slightly to prevent condensation within downstream piping before exiting the dryer.

Control and Monitoring Features

The HPR25 typically includes control systems that monitor pressure, temperature, and operational status. Features may include:

- Digital display for real-time system status
- Automatic shutdown or alarms in case of faults
